Generative Ai

My understanding of generative AI and its applications in creative fields stems originally from my interest in video editors using AI to enhance effects within their edits. I then wanted to explore more into image and video generative AI. I started first to experiment with the most up to date models at the time which produced mediocre quality outputs with low adherence to prompts. This forced me to learn how to navigate AI very particularly and specifically to achieve the outputs I wanted. As time progressed and models got better, my quality of work and efficiency increased by a lot as I was able to have better adherence. My previous practices on the older models stayed beneficial as they helped me gain an understanding of how AI is evolving itself through time. To this day I see it used more than ever all across social media. My favourite applications to see are when AI is used as a tool to help better output certain elements and aspects of a physical art piece, video edit, graphic design, etc.

One work of generative AI-driven art that inspires me is the work of Ivan Rafalchuk, a visual effects artist who goes by the online alias “Furys”, based in Tbilisi, Europe. I am most inspired by the way he incorporates generative AI to produce real still images into animated

videos. In doing so he is able to achieve 4k quality, as well as being able to customly adhere the video animations in certain aspects to be able to make 2 completely different video clips transition together as if it was filmed in one take. He is also able to create filler clips, longer cinematic clips, etc, which serve as a great help when you are in need of more footage to create certain visual effects.
